Glossary: Terms Used in This Book

This section defines every term used in the book. No charts here — just clear meaning.

Candlestick: A price bar showing Open, High, Low, Close for a time period.

Wick: The thin line showing where price tried to go but was rejected.

Body: The thicker part showing the distance between open and close.

Range: The distance between high and low.

Trend: Directional bias. Uptrend = HH/HL. Downtrend = LL/LH.

HH / HL: Higher High / Higher Low (uptrend structure).

LL / LH: Lower Low / Lower High (downtrend structure).

Level: A price area that matters because price reacted there before.

Zone: A level treated as a range (band), not a single price.

Support: Zone where price tends to bounce up (buyers defend).

Resistance: Zone where price tends to reject down (sellers defend).

Liquidity: Orders around obvious highs/lows that can be targeted.

Sweep: Price runs an obvious high/low then snaps back (liquidity grab).

Rejection: Strong failure to continue past a level/zone (often shown by wicks).

BOS: Break of Structure: break a key swing that held the prior trend.

Retest: Return to the broken level/zone to confirm it.

Order Block (OB): Last opposing candle before an impulse; used as a zone.

HTF: Higher timeframe used to set bias (e.g., H1/H4).

LTF: Lower timeframe used to trigger entries (e.g., M1/M5).

Entry: Execution price/area. Marked with a BLUE line.

Stop Loss (SL): Invalidation level where you exit if wrong. Marked RED.

Take Profit (TP): Target where you take profit. Marked GREEN.

Risk: How much of your account you are willing to lose on a trade.

R-Multiple (R): Your risk unit: if risk is \$10, +1R = +\$10.

Reward-to-Risk (R:R or RR): Potential reward divided by risk (e.g., 2R target = 2:1).

Session: Time window where liquidity/volatility changes.

Why This Book Was Created

Gold rewards structure and punishes emotion. Many traders lose because they enter without confirmation, chase price, and move stops after the fact. This playbook was created to cut through noise and turn your execution into a repeatable process.

Instead of hunting for indicators, you learn to wait for evidence: structure, liquidity behavior, and confirmation (BOS + retest). When those show up, you execute a simple plan: Entry (blue), SL (red), TP (green).

This book focuses on two patterns that keep showing up in Gold: continuation and reversal. Master them and you reduce decision fatigue, improve discipline, and journal with clarity.

Introduction: Trading in Context

Trading is as old as civilization. Before screens existed, people traded real goods in open marketplaces. Prices moved because supply and demand changed — and because humans reacted with fear, greed, and urgency.

As trade expanded, markets became organized. Exchanges standardized contracts and settlement. Modern markets still do the same thing: discover a price and transfer risk.

Charts don't create price. People do. Candlesticks are a record of behavior: where price pushed, where it was rejected, and where agreement happened.

Gold often moves with strong volatility and clear liquidity runs. That makes it suitable for structure-based trading — if you respect risk and wait for confirmation instead of guessing.

Every example in this playbook includes Entry (blue), SL (red), and TP (green), aligned between the line chart and the candlestick chart.

Core Concepts (with Diagrams)

Each concept uses the same visual language:

- **Zones/OB:** light gray shaded box with dashed border.
- **Prior level:** thin light-gray dashed line.
- **BOS level:** thicker dark dashed line.
- **Retest zone:** shaded band around BOS level.
- **Entry/SL/TP:** blue/red/green solid lines.

Candles & Rejection (read this first)

Figure: Candle anatomy and rejection behavior.

Market Structure (HH/HL)

Market structure: HH & HL

Line chart: Mark structure first. If you cannot label HH/HL (or LL/LH), you have no bias.

Market structure: HH & HL (candles)

Candles: Same concept, same markings.

Levels and Zones (Support/Resistance)

Line chart: Treat levels as zones (areas), not a single price.

Candles: Same concept, same markings.

Order Blocks (OB)

Order Block (OB) zone before impulse

Line chart: An OB is used as a zone; extend it right until invalidated.

Order Block (OB) zone before impulse (candles)

Candles: Same concept, same markings.

BOS + Retest

BOS + Retest (confirmation)

Line chart: A BOS changes the narrative. The retest is where you look for execution.

BOS + Retest (confirmation) (candles)

Candles: Same concept, same markings.

Liquidity Sweeps + Rejection

Line chart: Sweeps grab liquidity at obvious levels. Rejection is the clue.

Liquidity sweep + rejection (candles)

Candles: Same concept, same markings.

Continuation Pullback

Continuation: pullback into zone then continuation

Line chart: Wait for a pullback into a zone and a reaction before executing.

Continuation: pullback into zone then continuation (candles)

Candles: Same concept, same markings.

Strategy 1: Continuation

Trade with dominant structure. Enter on pullbacks into zones after reaction.

- **1) Bias (HTF):** Identify trend + key zones.
- **2) Pullback:** Price returns into a zone.
- **3) Reaction:** Rejection or slowdown in the zone.
- **4) Execute:** Entry (blue), SL (red), TP (green).

Chart callouts: 1 = Zone, 2 = Execute plan.

Continuation Example 1

Continuation example 1 (up): zone + Entry/SL/TP

Line chart: zone + aligned Entry/SL/TP.

Continuation example 1 candles: same levels

Candles: same zone + same Entry/SL/TP levels.

Continuation Example 2

Continuation example 2 (up): zone + Entry/SL/TP

Line chart: zone + aligned Entry/SL/TP.

Continuation example 2 candles: same levels

Candles: same zone + same Entry/SL/TP levels.

Continuation Example 3

Continuation example 3 (down): zone + Entry/SL/TP

Line chart: zone + aligned Entry/SL/TP.

Continuation example 3 candles: same levels

Candles: same zone + same Entry/SL/TP levels.

Strategy 2: Reversal

Reversal only after confirmation: Sweep → BOS → Retest. No BOS = no trade.

- **1) Sweep:** Price runs a prior obvious level.
- **2) Rejection:** Price closes back inside.
- **3) BOS:** Structure breaks against the previous direction.
- **4) Retest:** Return to BOS level/zone.
- **5) Execute:** Entry (blue), SL (red beyond sweep), TP (green).

Chart callouts: 1 = Sweep, 2 = BOS, 3 = Retest, 4 = Execute plan.

Reversal Example 1

Reversal example 1 (down): Sweep → BOS → Retest + Entry/SL/TP

Line chart: prior level (light dashed) + BOS level (dark dashed) + retest zone + aligned Entry/SL/TP.

Reversal example 1 candles: same levels

Candles: same levels and zones; sweep wick emphasized; Entry/SL/TP aligned.

Reversal Example 2

Reversal example 2 (up): Sweep → BOS → Retest + Entry/SL/TP

Line chart: prior level (light dashed) + BOS level (dark dashed) + retest zone + aligned Entry/SL/TP.

Reversal example 2 candles: same levels

Candles: same levels and zones; sweep wick emphasized; Entry/SL/TP aligned.

Reversal Example 3

Reversal example 3 (down): Sweep → BOS → Retest + Entry/SL/TP

Line chart: prior level (light dashed) + BOS level (dark dashed) + retest zone + aligned Entry/SL/TP.

Reversal example 3 candles: same levels

Candles: same levels and zones; sweep wick emphasized; Entry/SL/TP aligned.

Risk Management (Non-Negotiables)

If risk is not controlled, no strategy matters. Use these rules to protect your account and your mindset.

- **Risk per trade:** 0.5% to 1% of balance (start at 0.5% while learning).
- **Daily stop:** stop after -2R (new traders) or -3R (experienced).
- **Max trades per day:** 3 (quality over quantity).
- **No widening stops:** stops only tighten, never loosen.

Setup quality grading:

- **A-setup:** All rules present (bias + zone + confirmation). Clean space to TP. No news spike.
- **B-setup:** Rules present but one element is weaker (messy structure or crowded levels). Smaller size or skip.
- **C-setup:** Missing confirmation (no BOS, no reaction, chasing). Skip completely.

If you cannot explain your trade in one sentence using the glossary terms, it's not an A-setup.

Trade Journal (Printable)

Track execution quality — not just wins/losses. This helps you improve faster.

Date	Time	Setup	Grade	Rules OK	Entry	SL	TP	Result (R)	Notes (1–2 lines)
		Cont/Rev	A/B/C	Y/N					
		Cont/Rev	A/B/C	Y/N
